

(a) BEV Fusion

Both modalities →
shared BEV grid

● Radar Detection ■ Camera Features

(b) Frustum Association

Radar → image plane
→ frustum extraction

Figure 1: Two dominant radar-camera association strategies. (a) BEV fusion projects both modalities into a shared top-down grid for joint processing. (b) Frustum-based association projects radar detections into the camera image plane and extracts features within a range-defined frustum.
