

Chapter 1

Setting up your environment:

- Inside the gamedev folder, create a new folder called MyGame (whatever your game is called). Copy the CONTENTS of my folder into the MyGame folder. It should contain a folder(Source) and a makefile.
- To start editing the file(s) I have provided you with, open VS Code (Visual Studio=VS) and open the MyGame folder.
- Click terminal at the top of the page of VS Code and create a new terminal. By default, a Powershell terminal will open.
- Click the small down arrow beside the plus icon in the terminal area, then select 'Command Prompt'. View Figures 1.1 & 1.2 for Reference.

Compiling Your Code:

- In the Terminal type `cd C:\`, then press enter. Then type `cd gamedev\MyGame`.
- Every time you save your C code, you can type `make` into the terminal, and it will compile the GBA code for you.

Running your Compiled Code:

- Open VBA(Visual Boy Advance).
- Click 'Open' and navigate to `C:\gamedev\MyGame` and select your GBA file.
- Every time you compile your code, you will need to open your file again.
