

Strengths

1. **CSTM is elegant and modular.** A single scaling factor $\omega = f^c/f$ handles all camera diversity. No architecture changes needed; works with any backbone.
2. **Learning normals from depth-only data.** The consistency loss L_{d-n} sidesteps the scarcity of outdoor normal annotations ($\sim 20K$ images). The network learns normals as a *byproduct* of depth prediction.
3. **Comprehensive evaluation.** Tested on 16+ benchmarks spanning indoor, outdoor, in-the-wild, and downstream tasks (3D reconstruction, SLAM, metrology).
4. **Immediately usable.** Available via PyTorch Hub with multiple model sizes (ViT-S, ViT-L, ViT-G). One line of code to run inference.
